- Active Visual Charts
- Multiple Information Views
- Secure Role-Based Access
- Database Agnostic
- Advanced Business Rules
- Advanced Workflow
- Notification Services
- Document Provisioning
- Enterprise Search
- COTS Technology
- Web Client
- Extensive Reporting
- Exchange Integrated

Task Management: Visibility & Accountability

Are you flying blind? Task and workload management is a challenge to executives and workers alike. Done successfully, it reduces organizational risk, saves time, money and resources and improves productivity. TKCC Task Navigator, powered by Microsoft Dynamics CRM, allows managers and workers to collaboratively and proactively manage task workloads in real time.

Complete transparency and visibility into task status and workflow promotes accountability and resource allocation flexibility to ensure tasks are finished on time. Collaborative features provide automated notifications on task assignment and status, and allow task contributors to alert management to potential roadblocks before tasks become overdue. Visual navigation serves up actionable intelligence at-a-glance, allowing proactive management-by-exception.

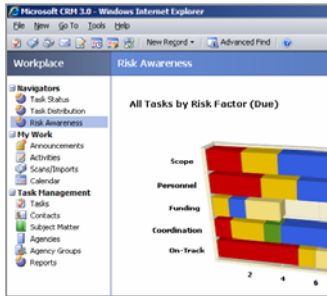

Distinctive Features

Secure Access

Role-based access determines which information views are available to each user. Hierarchical views are available and dependent on user access rights.

Dynamic GUI Navigation

Information is displayed in graphical and list format. All charts are fully interactive and clickable for deeper drill-downs into the information they display. Multiple views and more than one hundred charts are available.

Advanced Workflow & Business Rules

These features provide granular control over task assignment, notification and alert services. They allow users to manage proactively, staying ahead of deadlines and planning around potential risks.

Database Agnostic

TKCC Task Navigator can access, integrate and seamlessly present information from any database source. This protects investments in existing systems and applications.

Document Provisioning

Creation of a task automatically provisions a document repository specific to that particular task. This allows task contributors easy access to all documents related to the task. Rights management technology can be integrated for greater control over sensitive, controlled or classified information.

Enterprise Search

This feature allows keyword, subject and phrase match searches across all document repositories and task note or status update fields.

COTS-Based Solution

TKCC Task Navigator is powered by Microsoft Dynamics CRM. Document repositories are created in Microsoft SharePoint. Other integrated Microsoft technologies include Outlook/Exchange, Office, SQL Server and Rights Management Server. These proven, secure technologies guarantee reliability and a consistent upgrade path.

Web Client

TKCC Task Navigator employs a web-based client, requiring no configuration changes to user machines. All data is kept on the application server, which resides securely behind the network firewall.

Flexible Technology

There are no extraordinary hardware requirements and the solution scales easily to accommodate additional communities of users.

Extensive Reporting

An impressive array of out-of-the-box reports are provided. Reporting services can be user-driven or automated, depending on user preference. Ad-hoc or additional report templates are created easily with the report wizard.

Reducing Risk

TKCC Task Navigator provides complete visibility, accountability and transparency into the task process. It allows executives and workers to achieve greater productivity through real-time, proactive task management and resource allocation.

Building on a foundation of world-class Microsoft technologies protects customer investment and provides a stable, dependable platform now and in the future.
